We observe a low-rank signal matrix corrupted by additive noise:

 $\widehat{M} = \underbrace{M}_{+} \underbrace{E}_{-}.$ signal noise

▲□▶▲□▶▲□▶▲□▶ □ のQ@

We observe a low-rank signal matrix corrupted by additive noise:

The signal matrix M is assumed to be (low) rank r with (thin or compact) singular value decomposition (SVD)

 $M = U \wedge V^{\top}$

- *U* ∈ D(*n*, *r*) is matrix of leading left singular vectors (its columns *U*, are orthonormal unit vectors)
- Λ is a diagonal r × r matrix of singular values
 λ₁ ≥ λ₂ ≥ · · · ≥ λ_r > 0
- V ∈ O(d, r) is matrix of leading right singular vectors

The Problem ○○○○○○●○○	Theoretical Results	Numerical Example	Conclusion	References
General N	Model			

We observe a low-rank signal matrix corrupted by additive noise:

$$\widehat{M} = \underbrace{M}_{\text{signal}} + \underbrace{E}_{\text{noise}}.$$

The noise matrix *E* has

- independent, mean-zero rows of the form $E_{i} = \sum_{i}^{1/2} Y_{i}$
- $\Sigma_i \in \mathbb{R}^{d \times d}$ is a positive semidefinite matrix
- Y_i ∈ ℝ^d is a vector with independent (sub)gaussian components with variance one

General I	Model			

Goal: Most Precise

Develop *fine-grained statistical theory* for an estimator \hat{U} of the $n \times r$ matrix U of leading left singular vectors of M upon observing M + E

Problem

When rows of *E* have different covariances (heteroskedasticity), the left singular vectors of M + E can be biased!

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

The Problem	Theoretical Results	Numerical Example	Conclusion	References
General I	Model			

Goal: Most Precise

Develop fine-grained statistical theory for an estimator \hat{U} of the $n \times r$ matrix U of leading left singular vectors of M upon observing M + E

Problem

When rows of *E* have different covariances (heteroskedasticity), the left singular vectors of M + E can be biased!

Solution

Use HeteroPCA algorithm of Zhang et al. (2022) to *debias* the estimated singular vectors.

HeteroPCA Algorithm (Zhang et al., 2022)

Algorithm 1: HeteroPCA Algorithm of Zhang et al. (2022)

Input : $N_0 = \widehat{M}\widehat{M}^{\top} - \operatorname{diag}(\widehat{M}\widehat{M}^{\top})$, max number of iterations T_{\max} while $T \leq T_{\max}$ do $| \widetilde{N}_T := \operatorname{SVD}_r(N_T)$, the best rank *r* approximation to N_T ; $N_{T+1} := N_T - \operatorname{diag}(N_T) + \operatorname{diag}(\widetilde{N}_T)$; end Return: \widehat{U} = Left *r* singular vectors of $N_{T_{\max}}$

4 Conclusion

Asymptotic Normality: *r* fixed

Theorem (Agterberg et al. (2022))

Suppose some technical and regularity conditions hold, and suppose the signal-to-noise ratio is sufficiently large. Define

 $S^{(i)} := \Lambda^{-1} V^{\top} \Sigma_i V \Lambda^{-1}.$

Then as $n, d \to \infty$, with $d \ge n \ge \log(d)$, there exists a sequence of $r \times r$ orthogonal matrices \mathcal{O}_* such that

 $(S^{(i)})^{-1/2} (\widehat{U}\mathcal{O}_* - U)_{i.} \rightarrow N(0, I_r).$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Asymptotic Normality: *r* fixed

Theorem (Agterberg et al. (2022))

Suppose some technical and regularity conditions hold, and suppose the signal-to-noise ratio is sufficiently large. Define

 $S^{(i)} := \Lambda^{-1} V^{\top} \Sigma_i V \Lambda^{-1}.$

Then as $n, d \to \infty$, with $d \ge n \ge \log(d)$, there exists a sequence of $r \times r$ orthogonal matrices \mathcal{O}_* such that

$$(S^{(i)})^{-1/2} (\widehat{U}\mathcal{O}_* - U)_{i} \rightarrow N(0, I_r).$$

Asymptotic covariance of *i*'th row of \hat{U} depends on how *i*'th row of noise matrix *E* interacts with Λ and *V*.

Singular vectors of
$$\widehat{M} =$$
 Eigenvectors of $\widehat{M}\widehat{M}^{\top}$
 \approx Eigenvectors of $\mathbb{E}(\widehat{M}\widehat{M}^{\top})$
 $=$ Eigenvectors of $MM^{\top} + D_{ii}$
where $D_{ii} = \text{Trace}(\Sigma_i)$.

Problem

If Σ_i 's are different (i.e. *heteroskedastic*), then the singular vectors of \widehat{M} are approximating a *deterministic diagonal perturbation* of MM^{\top} .

• Could delete the diagonal of $\widehat{M}\widehat{M}^{\top}$ and take eigenvectors of that

▲□▶▲□▶▲□▶▲□▶ □ のQ@

- Could delete the diagonal of $\widehat{M}\widehat{M}^{\top}$ and take eigenvectors of that
- Still biased! Then this approximates the eigenvectors of the matrix

 $\boldsymbol{M}\boldsymbol{M}^\top - \operatorname{diag}(\boldsymbol{M}\boldsymbol{M}^\top) \neq \boldsymbol{M}\boldsymbol{M}^\top$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

- Could delete the diagonal of $\widehat{M}\widehat{M}^{\top}$ and take eigenvectors of that
- Still biased! Then this approximates the eigenvectors of the matrix

$$MM^{\top} - \operatorname{diag}(MM^{\top}) \neq MM^{\top}$$

- Just deleting the diagonal results in an error that does not *scale with the noise*
- Our idea: use existing HeteroPCA algorithm of Zhang et al. (2022) to *impute* the diagonals

• Covariance Condition Number.

$$\kappa_{\sigma} := \max_{i,j} \frac{\sigma}{\|\boldsymbol{\Sigma}_{i}^{1/2} \boldsymbol{V}_{.j}\|}$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Quantifies the geometric relationship with the covariance structure of the noise on the right singular subspace V

- Consider the following special case:
 - $\Sigma_i \equiv I_d$ for all *i* (or any multiple)
 - Then $\kappa_{\sigma} \equiv 1$

Asymptotic Normality: *r* fixed

Theorem (Agterberg et al. (2022))

Suppose that κ , μ_0 , and κ_σ are bounded, and that r is fixed. Suppose that

$$\max\left\{\frac{\log(d)}{\mathrm{SNR}}, \max_{j} \frac{\|\boldsymbol{\Sigma}_{j}^{1/2}\boldsymbol{V}_{j}\|_{3}^{3}}{\|\boldsymbol{\Sigma}_{j}^{1/2}\boldsymbol{V}_{j}\|^{3}}\right\} \to 0$$

as $n, d \to \infty$, with $d \ge n \ge \log(d)$. Define

 $S^{(i)} := \Lambda^{-1} V^{\top} \Sigma_i V \Lambda^{-1}.$

Then there exists a sequence of orthogonal matrices \mathcal{O}_* such that

$$(S^{(i)})^{-1/2} (\widehat{U}\mathcal{O}_* - U)_{i.} \rightarrow N(0, I_r).$$

Asymptotic Normality: *r* growing

Theorem (Agterberg et al. (2022))

Suppose that κ , μ_0 , and κ_σ are bounded. Suppose that

$$\max\left\{\frac{r\log(d)}{\sqrt{n}}, \frac{r\log(d)}{\mathrm{SNR}}, \frac{\|\sum_{i}^{1/2} V_{ij}\|_{3}^{3}}{\|\sum_{i}^{1/2} V_{ij}\|_{3}^{3}}\right\} \to 0$$

as $n, d \to \infty$, with $d \ge n \ge \log(d)$. Define

$$\sigma_{ij}^2 := \frac{\|\boldsymbol{\Sigma}_i^{1/2} \boldsymbol{V}_{\cdot j}\|^2}{\lambda_j^2}.$$

Then there exists a sequence of orthogonal matrices \mathcal{O}_\ast such that

$$\frac{1}{\sigma_{ij}}(\widehat{U}\mathcal{O}_*-\boldsymbol{U})_{ij}\to N(0,1).$$
